### INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/JP2004/018442

#### Re Item V

IAPZO Hac'd PCTIPTO 30 MAY 2006

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- 1. Reference is made to the following document:
  - D1: BAKER T P ET AL: "THE CYCLIC EXECUTIVE MODEL AND ADA"
    PROCEEDINGS OF THE REAL TIME SYSTEMS SYMPOSIUM. HUNTSVILLE,
    DEC. 6 8, 1988, WASHINGTON, IEEE COMP. SOC. PRESS, US, vol. SYMP.
    9, 6 December 1988 (1988-12-06), pages 120-129, XP000118714
- 2. The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 does not involve an inventive step in the sense of Article 33(3) PCT.
- 2.1. Document D1 is regarded as being the closest prior art to the subject-matter of claim 1, and insofar as this claim and the corresponding passages in the description can be understood, this document shows the following features thereof (the references in parentheses applying to this document).

A task management system for executing a task selected from tasks structuring a task combination (cyclic executive supports two modes, with mode 0 controlling four periodic processes and mode 1 controlling another set of processes)(section 4 "Mode changes", first five lines), comprising:

a judging unit for judging whether there is a task combination switchover request or not (when an event requesting a mode change is received)(page 123, left-hand column, lines 1-7);

a switchover unit for switching over the task combination after completing an execution of a task in the tasks structuring the task combination before the switchover when judging that there is the switchover request (the requested mode change can take place at the end of the current action, at the end of the current frame or at the end of the major cycle); and

an execution unit for executing the task selected from the tasks structuring the task

combination switched over by said switchover unit (the mode is switched and the new set of processes is executed).

- 2.2. The subject-matter of claim 4 therefore differs from this system known from document D1 in that the claimed system comprises:
  - a switchover unit for switching over the task combination after completing an execution of a specified task whereas, in document D1, said specification is not explicitly disclosed.
- 2.3. The technical effect produced by the above identified difference can be regarded as being the improved knowledge about the state of the system because the identity of the last task to be executed before the switchover could take place is known in advance.
- 2.4. The objective technical problem to be solved may thus be regarded as how to provide for a better defined state of the system upon said switchover.
- 2.5. The method of document D1 discloses three possible ways to handle the execution of a switchover request. The corresponding levels of knowledge about the identity of the last task, namely the sets comprising the possible last tasks before the actual switchover, are, in increasing order of determinism:
  - i) a set with all the tasks, when the switchover is carried out at the end of the current task,
  - ii) a set with the last tasks of all frames, when the switchover is carried out at the end of the current frame,
  - iii) a set with one task, when the switchover is carried out at the end of the major cycle.

The person skilled in the art, in order to solve the above said technical problem, would regard as a normal design procedure the selection, out of a finite number of equally likely alternatives, of an intermediate way of handling the switchover, namely one which would produce a set comprising only arbitrarily selected tasks, arriving, thus, to a system as claimed.

- 2.6. Therefore, the subject-matter of claim 1 does not involve an inventive step (Art. 33(3) PCT).
  - The same reasoning applies, mutatis mutandis, to the subject-matter of claim 4, which is, therefore, also not inventive (Art. 33(3) PCT).
- 2.7. As to dependent claims 2, 3, 5 and 6, their subject-matter is also regarded as being not inventive (Art. 33(3) PCT), the presence of the additional features contained therein being regarded as obvious to the skilled person.

#### Re Item VIII

### Certain observations on the international application

- 1. The description is not in conformity with the claims as required by Rule 5.1(a)(iii) PCT. Due to the particular way in which the sentences have been built and to the terminology used therein, the technical problem as well as its solution and the produced advantageous effects can be hardly identified and understood.
- 1.1. Moreover, the description is also not in conformity with the provisions of Art. 5 PCT; with regard to clarity, in particular, a crystal clear contradiction can be identified between the sentence "Further, another effect is that the task combination can be switched over without executing the process (such as an execution of the task of which the process completion is not requested when switching over the task combination) that should not be processed." of page 21, lines 11-15 and the sentence "Further, another effect is that the task combination can be switched over without executing the process that should be processed." of page 22, lines 13-15, which renders the whole description obscure.

Andrea Carciofi (Examiner)
